WEEK 3&4 LAB

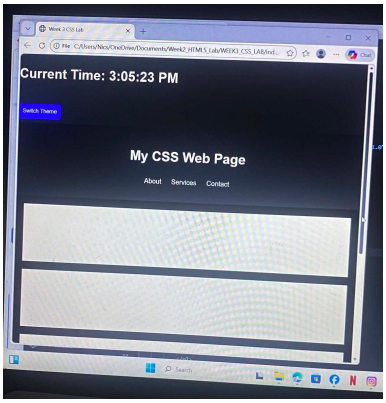

In this laboratory which is Lab week 4, JAVA script Basics & DOM Manipulation, just continuation or connected to laboratory week 3 which is the CSS.

STEP 1:Linking JAVA Script to HTML & Updating Page Title

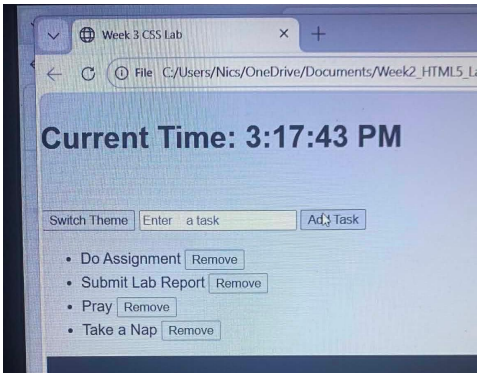

Description: In this step, I connected the JavaScript file to the HTML file. I also used JavaScript to update the title of the web page dynamically. This helped me understand how JavaScript can interact with HTML elements and change the content of a web page.

STEP 2: Implementing Dark\Light Mode with Local Storage

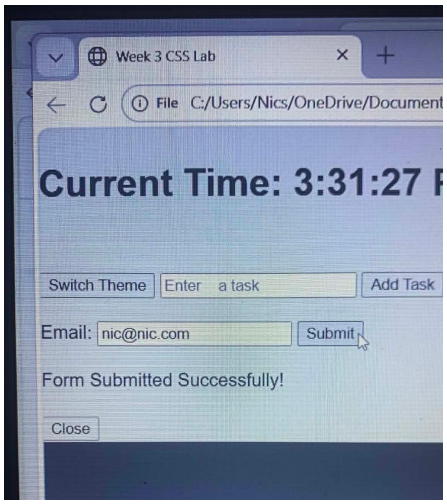

Description: In this step, I created a dark and light mode feature. JavaScript was used to switch between the two themes, while local Storage was used to save the user's selected theme. This allowed the web page to remember the user's preference even after refreshing the page.

STEP 3: Adding a Dynamic To-Do List

Description: In this step, I created a to-do list where users can add tasks dynamically. JavaScript was used to get the user's input, create new list items, and display them on the webpage. This helped me understand how JavaScript can manipulate the DOM and respond to user actions.

STEP 4: Implementing Form Validation with Modal Popup

Description: In this step, I added form validation to check if the required information was properly entered. A modal popup was also used to display a message after the form was submitted. This made the web page more interactive and helped me learn how JavaScript can handle forms and user input.

REFLECTION:

During this activity, I encountered some challenges while implementing JavaScript, especially when connecting JavaScript with HTML and making sure that the code worked correctly with the elements on the page. At first, I found it difficult to understand how JavaScript could access and change HTML elements using the DOM. I also experienced some errors when working with event listeners and making sure that the buttons performed the correct actions.

Another challenge I encountered was implementing the dark and light mode using local Storage. I needed to understand how to save the selected theme and retrieve it when the page was refreshed. Creating the dynamic to-do list was also challenging because I had to use JavaScript to create new elements and display them without manually adding them to the HTML. Through this activity, I learned several important JavaScript concepts, including DOM manipulation, event listeners, functions, conditional statements, local Storage, and form validation. I also learned how JavaScript can make a web page more interactive by responding to user actions such as clicking buttons, submitting forms, and adding tasks.

Overall, this activity helped me understand the practical use of JavaScript in web development. Although I encountered errors and had to troubleshoot my code, I learned that testing and debugging are important parts of programming. I became more comfortable using JavaScript and gained a better understanding of how HTML, CSS, and JavaScript work together to create an interactive web page.
